Supplementary Information

Design variation is not design evidence: an audit of basic-income and guaranteed-income experiments

Rogelio Diaz-Mendez

Scope. This supplement documents the frozen evidence behind the main article. It adds no analysis: every table is generated from the frozen coded tables of the project repository, and every count is checked against the frozen values before the supplement is built. Study references are listed in the main article. The four comparison-level support stages are variation (V), isolation (I), compatible estimand (E) and usable uncertainty (U); independent validation is a separate requirement of the prospective discovery-and-validation test, not a fifth stage, and formal transport from a single source under stated assumptions remains possible.

S1 Evidence frame status

Layer A is a census of a frozen, frame-defined universe of 43 modern experiments. It is not a census of every basic-income or guaranteed-income experiment. Of the 43 frame members, 39 were verified against primary sources, 2 remained pending and 2 had unresolved frame conflicts; all were retained, and none of the four unverified members belongs to a strictly supported family (Table S1). Layer B is a separate audit of 9 historical and adjacent designs; it is not a census, and the two layers are never pooled into a single denominator.

Table S1: Layer A frame members and verification status (frozen frame; source: `evidence_universe/layer_a_reconciliation/RECONCILED_LAYER_A_MANIFEST.csv`).

S2 Full architecture-support grid

Table S2 shows every Layer A cell: the 43 experiments by the six coded dimensions, in the employment domain. Each cell gives the variation code and, where the feature varies, the isolation, estimand and uncertainty codes of the cell's representative comparison. The summary rows are recomputed from the cells. They reproduce the frozen counts: 9, 7 and 2 families vary withdrawal, conditionality and cadence, of which 1, 1 and 0 pass the within-study strict path; 26 and 33 families vary magnitude and promised duration and 6 report a baseline employment share, of which 6, 6 and 2 have a compatible estimate with usable uncertainty between studies, where isolation does not apply. Magnitude cannot be computed for 17 experiments and baseline employment is unknown for 37; unknown is recorded as unknown, never as no variation.

Table S2: Full Layer A support grid: 43 experiments × 6 dimensions, employment domain.

ID	Experiment	Magnitude (B2)	Withdrawal	Conditionality	Cadence	Duration	Baseline employment
Families with V = Y		26	9	7	2	33	6
Families with V = UNKNOWN		17	1	3	1	2	37
Strict (†): within-study or between-study		6	1	1	0	6	2

Cell = V, then (when V = Y) I, E and U codes. V: Y varies, N no variation, ? unknown. I: P pure, CB conditionable bundle, B bundled, NI not isolated (between-study), MO model-only, ne not established, – not applicable. E: A employment probability, A* with a documented caveat, B other extensive-margin object, C other labour outcome, 0 none reported. U: SE, CI, p exact p-value, t test statistic, pc p-value category, st stars, vb verbal, ni not integrated, 0 none. † = passes the strict path: for withdrawal, conditionality and cadence the within-study path (isolation P or CB, E-A-compatible estimand, SE or CI); for magnitude, duration and baseline employment the between-study summary (E-A-compatible estimand with SE or CI; isolation does not apply). Summary rows are recomputed from the cells and checked against the frozen counts. Source: `evidence_universe/layer_a_geometry/LAYER_A_SUPPORT_GRID.csv`.

S3 Near-miss inventory

Table S3 (the former main-text Table 3) contains 13 rows, each one dimension–design entry, representing 12 unique designs; each design is a distinct experiment, transport family and dependence group. The rows are the 11 isolated family–dimension support entries shown in Figure 4 of the main article (from 10 distinct transport families, because Wageningen is isolated on both withdrawal and conditionality) and 2 bundled key comparators (Seattle-Denver for withdrawal and Minnesota MFIP for conditionality), each with the stage at which it stops. The row-by-row derivation is in `revision_v1/NEAR_MISS_ONTOLOGY_AUDIT.csv`.

- **Withdrawal.** B-MINCOME passes the strict path. RIME, New Jersey-Pennsylvania and Gary are useful isolated designs, but no compatible direct employment contrast with usable uncertainty was located in the sources read. For RIME, no compatible published direct contrast was located in the accessible RIME-family record after the bounded search (Section S7); we do not conclude that the contrast was never estimated. Wageningen is isolated but reports a broader extensive-margin object.
- **Conditionality.** Utrecht passes the strict path. The Vermont Welfare Restructuring Project has a pure contrast and a compatible employment estimate, but only significance stars are published in the accessible evidence, so usable uncertainty is blocked.
- **Cadence.** Compton reports a compatible estimate with an exact p-value only; the Nigeria FNLP cash arms report an employment probability with a definitional caveat and a verbal statement only; Newark has a clean cadence design but no focal employment result.
- **Duration.** Horizon variation is abundant between studies (33 families vary the promised duration; 6 have a compatible estimate with usable uncertainty), but it is entangled with study identity, and no adequately isolated employment-domain duration pair exists. The within-study horizon contrasts of SIME/DIME and the GiveDirectly Kenya study concern hours or other outcomes outside the strict target (Table S4).

Table S3: Where key designs stop (former main Table 3). One row per dimension–design entry: isolated family–dimension entries and two bundled key comparators. Isolation, estimand and uncertainty are the codes of the focal comparison; "Stops at" is the first strict stage not passed.

Dimension	Design	Isolation	Estimand	Uncertainty	Stops at
Withdrawal	B-MINCOME	CONDITIONABLE-BUNDLE	E-A	SE	passes
Withdrawal	RIME	PURE	NONE	NONE	estimand
Withdrawal	New Jersey-Pennsylvania NIT	PURE	NONE	NONE	estimand
Withdrawal	Gary NIT	PURE	NONE	NONE	estimand
Withdrawal	Wageningen	PURE	E-B	SE	estimand
Withdrawal	Seattle-Denver NIT (Denver)	BUNDLED	E-A	NOT-INTEGRATED	isolation
Conditionality	Utrecht	PURE	E-A	SE	passes
Conditionality	Vermont WRP	PURE	E-A	STARS	uncertainty
Conditionality	Wageningen	PURE	E-B	SE	estimand
Conditionality	Minnesota MFIP	BUNDLED	E-A (caveat)	STARS	isolation
Cadence	Compton Pledge	PURE	E-A	EXACT-P	uncertainty
Cadence	Nigeria FNLP cash	CONDITIONABLE-BUNDLE	E-A (caveat)	VERBAL	uncertainty
Cadence	Newark	PURE	NONE	NONE	estimand

Table S4: Duration rows of the audited Layer B: no row is both isolated and has a compatible employment estimand with usable uncertainty.

Design	Row	Isolation	Estimand	Uncertainty	Blocker
Rural Income-Maintenance Experiment (RIME)	Duration	NOT-ISOLATED	E-A (caveat)	EXACT-P	I: NOT-ISOLATED

(continued)

Design	Row	Isolation	Estimand	Uncertainty	Blocker
Seattle-Denver Income Maintenance Experiment (SIME/DIME)	Duration	CONDITIONABLE-BUNDLE	NONE (reported object: NONE)	NONE	E: NONE (no published focal employment result)
Seattle-Denver Income Maintenance Experiment (SIME/DIME)	Duration (hours row)	CONDITIONABLE-BUNDLE	NONE (hours, E-C)	TEST-STAT (hours row)	E: outcome domain (direct duration contrasts hours only)
GiveDirectly Kenya long-term UBI study	Duration	PURE	NONE (employment domain: no support row; frozen row is hours, E-C)	EXACT-P (hours row)	E: outcome domain (12-year vs 2-year promise, C-SG10-04: hours only)

S4 Full support paths and the Layer B audit

Tables S5–S7 list every support path for the three dimensions that can vary within a study, in both layers, with the last strict stage reached and the reason for stopping. Table S8 lists every audited Layer B row. Table S9 combines both layers as support counts, not as a census prevalence: Layer A has a denominator of 43, and Layer B is a design audit of 9 members. In the union, withdrawal counts are 13, 5, 1 and 1 (varies, isolated, compatible estimand, usable uncertainty); conditionality 9, 3, 2 and 1; cadence 3, 3, 2 and 0. The independent strict families are therefore 1, 1 and 0, and the prospective test's requirement of two independent families is not met for any dimension. Under the broader extensive-margin sensitivity, withdrawal and conditionality would each have 2 supporting families and cadence 0; this sensitivity does not replace the strict result. Layer B adds 3 isolated withdrawal families but no independent strict pair.

Table S5: Full support paths: withdrawal (Layer A census cells and Layer B audited paths).

Minnesota Family Investment Program	Withdrawal	ne	ne	ne	ne	NO	NONE	V: frame flag only (architecture_ flags_descriptive); no frozen withdrawal support case
Feed the Future Nigeria Livelihoods Project cash	Cadence	Y	CB	A (caveat)	vb	NO	NONE	U: VERBAL (not SE / CI)

Codes as in Table S2: V: Y, N, ? unknown, ne not established. I: P pure, CB conditionable bundle, B bundled, NI not isolated, MO model-only, ne, – not applicable. E: A employment probability, A* with caveat, B other extensive-margin object, C other labour outcome, 0 none. U: SE, CI, p exact p-value, t test statistic, pc p-value category, st stars, vb verbal, ni not integrated, mo model-only, 0 none. Source: `final_scope_c/LAYER_B_SUPPORT_AUDIT.csv`.

Table S9: Support-union counts (Layer A census cells plus Layer B audited paths): varies / isolated / + compatible estimand / + usable uncertainty.

Dimension	Layer A census	Layer B audit	Support union	E-B + uU (isolated)	Between-study E-A + uU	Strict families
Magnitude (B2)	26/0/0/0	0/0/0/0	26/0/0/0	0	6	NONE
Withdrawal	9/2/1/1	4/3/0/0	13/5/1/1	2	0	TF-BMINCOME
Conditionality	7/2/1/1	2/1/1/0	9/3/2/1	2	0	TF-UTRECHT
Cadence	2/2/1/0	1/1/1/0	3/3/2/0	0	0	NONE
Duration	33/0/0/0	2/1/0/0	35/1/0/0	0	6	NONE
Baseline employment	6/0/0/0	0/0/0/0	6/0/0/0	0	2	NONE

Union counts are support counts, not a census prevalence: Layer A has denominator 43; Layer B is a design audit of 9 members. E-B + uU is the broader extensive-margin sensitivity, not the strict result. Source: `final_scope_c/SCOPE_C_FINAL_SUPPORT_GEOMETRY.csv`.

S5 Minimum reporting for the prospective test

Table S10 gives the full list of 11 reporting items behind Box 1 of the main article, with the observed blocker each addresses. It is the minimum reporting that this project's prospective test needs. It is not a universal reporting guideline or a standard proposed for other purposes. Satisfying these items does not guarantee support, because isolation is a design property that reporting cannot supply.

Table S10: Minimum reporting needed by this project's prospective test, item by item, with the blocker each item addresses.

#	Requirement	Blocker	Observed blocker (frozen evidence)
1	Exact architecture of each intervention arm: transfer rule, withdrawal schedule, conditionality, payment cadence, promised horizon	V	Cells with V UNKNOWN / NOT-ESTABLISHED: Almere (all architecture dimensions), B-MINCOME and Ontario conditionality, Utrecht withdrawal isolation
2	Exact assignment counts and analysis populations	I	RIME plan probabilities NR; post-randomisation-selected analysis subsamples (RIME, Gary)
3	Direct, pre-specified arm-arm contrasts for each architecture factor	E	NJ-P, Gary and RIME same-G designs (PURE, E = NONE); Newark cadence (PURE, E = NONE); DIME higher vs lower groups not reported directly
4	Exact employment positive / negative states	E	Rules H / I: E-B threshold objects (Participatiewet municipalities); mixed or unresolved states in Layer A
5	ITT-compatible estimates where applicable	E	RIME analyses only post-randomisation-selected subsamples; response-surface (MODEL-ONLY) results substitute for design contrasts
6	SE or CI for every focal architecture contrast	U	WRP conditionality (stars only); Compton cadence (exact p only); FNLP cadence (verbal only); RIME (no SE / CI anywhere)
7	Covariance or factorial-estimator information when contrasts share a control	U	Multi-arm designs (RIME, NJ-P, Participatiewet) report arm-vs-control results only; combining them is not allowed
8	Baseline mean household income and the ex-ante transfer schedule (for B2)	B2	QS-101 NR or not established for RIME, Ontario, Finland and GWW (D041 cells); B-MINCOME B2 measurement class M3 (nonconforming)
9	Baseline employment definition and share for the assigned population	BASELINE	QS-105 NR in most families; RIME reports only subsample values
10	Implementation differences and services by arm	I	Bundled arms: MFIP (mandate + services), Participatiewet combination arms, DIME (G and duration pooled)

(continued)

#	Requirement	Blocker	Observed blocker (frozen evidence)
11	Machine-readable tables / data, or a reproducibility route	U / E	Restricted or embargoed data (WRP, FNLP COM-005); RIME and NJ-P access not established

Source: `final_scope_c/MINIMUM_REPORTING_FOR_TRANSPORTABLE_BI_EVIDENCE.md`.

S6 Codebook and global rule clarifications

All support codes follow the frozen coding manual (v1.4, `coding_reliability/CODEBOOK_v1.4.md`), with the code values summarised in Table S2. Ambiguities discovered during extraction were resolved by general rules, each frozen before the next stage and re-applied to every existing case, never by case-specific exceptions (Table S11). The blinded second coding pass covered 25 pre-census support cases under v1 of the manual; rules H, I and J were adopted after it, were re-applied globally, and were not independently second-coded.

Table S11: Codebook lineage. Each rule is general; each was re-applied to every existing case, never case by case.

Version	Record	Change	Frozen	Re-applied to	Blind second-coded
v1	D033	frozen codebook for the blinded second coding pass	before second coding	–	yes (25 pre-census cases)
v1.1	D034	general clarifications A–G after adjudication	after adjudication	all cases	no (clarifications of v1)
v1.2	D038	rule H: employment-domain positive-state rule	after census Batch 1	all cases	no
v1.3	D039	rule I: outcome-definition sufficiency	after census Batch 2	all cases	no
v1.4	D040	rule J: research-procedure co-interventions	after census extraction, before any geometry	all cases	no

Source: `coding_reliability/CODEBOOK_v1.4.md` (lineage and reliability status).

Rule H (verbatim opening of the rule)

"An outcome can be coded **E-A, E-A (caveat) or E-B** in the employment domain **only if the event / state being estimated is entirely a labour-market extensive-margin object.**"

Rule I (verbatim opening of the rule)

"An employment-like result can enter **E-A, E-A (caveat) or E-B** only when the available factual record is **sufficient to establish** that the estimated positive state belongs entirely to the employment / labour-market extensive-margin domain, under rule H and the existing E definitions."

Rule J (verbatim opening of the rule)

"Research procedures are not policy constructs. They **count as substantive co-interventions for I** when they **differ by assigned group during the causal window** and introduce one or more of:"

S7 RIME bounded search

The Rural Income-Maintenance Experiment assigned 5 negative-income-tax plans, which contain 3 same-guarantee contrasts of the withdrawal rate (Tables S12 and S13). These contrasts are pure designs for withdrawal. The bounded search of the RIME-family record (Table S14, 18 logged sources) did not locate a published direct employment contrast between same-guarantee plans with usable uncertainty; the reported labour results are pooled programme effects, post-randomisation subsamples or model-based response-surface slopes. No compatible published direct contrast was located in the accessible

RIME-family record after the bounded search. This is a bounded conclusion about the accessible record; we do not conclude that the contrast was never estimated, the final technical report was not accessible, and access to the participant-level data was not located (it was not sought).

Table S12: RIME assigned negative-income-tax plans.

Plan	Guarantee G (% of poverty line)	Withdrawal rate t (%)
X002-P50-50	50	50
X002-P75-30	75	30
X002-P75-50	75	50
X002-P75-70	75	70
X002-P100-50	100	50

Source: evidence_universe/layer_b_extraction/rime/arms.csv.

Table S13: RIME contrast graph: every pairwise design contrast and model-based slope.

ID	Class	Treatment vs reference	Same G	Same t	Focal dimension	Isolation candidate

S8 Source access and recoverability

Table S15 records the access status of routes that bear on the near-miss cases. It is access metadata, not evidence. For the Vermont Welfare Restructuring Project, restricted-use data (ICPSR Study 38060) are held by a data archive under a secure-download mechanism that requires ethics review, a data-security plan and an institutional data-use agreement. These requirements were not pursued in this independent project. The WRP conditionality contrast is therefore coded from its published report (stars only; no usable uncertainty), and the restricted data are not treated as observed evidence. Whether an existing design could yield usable uncertainty from such a route is discussed in the main article as a descriptive observation; it is not an additional audit stage.

Table S15: Source-access status of status-relevant routes (access metadata, not evidence).

Route	Access status	Use in this paper	Record
Vermont WRP restricted-use data (conditionality)	Restricted use; secure download requiring an ethics review document, a data-security plan and an institutional data-use agreement; not pursued	Near miss and provenance only; the contrast is coded from the published report (stars only)	`manuscript/supplement/S8_ACCESS_STATEMENT.md`
RIME final technical report	Not accessible (no public copy located)	Bounded-search record; no evidence used	`evidence_universe/layer_b_extraction/rime/SOURCE_LOG.csv`
RIME participant-level data	Access not located; not sought (no reanalysis)	Not used	`evidence_universe/layer_b_extraction/rime/SOURCE_LOG.csv`
NJ-P and RIME data access	Not established	Reporting item 11; not used	`final_scope_c/MINIMUM_REPORTING_FOR_TRANSPORTABLE_BI_EVIDENCE.md`
FNLP restricted or embargoed data	Restricted or embargoed	Reporting item 11; not used	`final_scope_c/MINIMUM_REPORTING_FOR_TRANSPORTABLE_BI_EVIDENCE.md`

S9 Software validation and mutation testing

The counts are produced by deterministic scripts from frozen coded tables, and the repository contains automated validators for each stage (Table S16). The validators recompute every count from the coded tables, check the gate logic and the family counting, confirm that frozen inputs are unchanged and that rebuilt outputs are identical, and check the manuscript wording against the frozen claims. Each validator is accompanied by mutation tests: deliberate corruptions of the inputs or of the manuscript, each of which the validator must reject, together with an unmodified control that must pass. The results are recorded in the decision records. These are software quality-assurance checks of internal consistency; they are not scientific validation of the coding or of the conclusions.

Table S16: Software validators in the repository (consistency checks of the coded tables and outputs; not scientific validation).

Validator	Purpose (first docstring line)
`coding_reliability/validate_blind_packet.py`	D033: validate the blind recoding packet. Exits 1 on failure.
`coding_reliability/validate_reliability_adjudication.py`	D034: validate the reliability comparison, the adjudication and the master-map update. Exits 1 on failure.
`evidence_universe/layer_a_extraction/validate_layer_a_extraction.py`	D037: validate the Layer A STAGING extraction (Batches 1-6, final; D038 and D039 re-applications). Exits 1 on failure.
`evidence_universe/layer_a_geometry/validate_layer_a_geometry.py`	D041: validate the Layer A census support geometry. Exits 1 on failure.
`evidence_universe/layer_a_reconciliation/validate_layer_a_reconciliation.py`	D040: validate the Layer A post-census reconciliation. Exits 1 on failure.
`evidence_universe/layer_b_extraction/rime/validate_rime_extraction.py`	D042: validate the RIME (X002) Layer-B extraction. Exits 1 on failure.
`final_scope_c/validate_final_scope_c.py`	D043: validate the final SCOPE-C support synthesis. Exits 1 on failure.
`manuscript/validate_manuscript_v0.py`	D045: validate manuscript draft v0. Exits 1 on failure. Checks 1-30 follow D045 section 34.
`manuscript/validate_manuscript_v1.py`	D047: validate manuscript v1 (LaTeX source of truth, compiled PDF, references, traceability, readiness status).
`manuscript/review/validate_d046_review.py`	D046: validate the adversarial review, figure build and revision plan. Exits 1 on failure. Checks 1-26 follow D046 section 29.
`paper/validate_paper_architecture.py`	D044: validate the paper architecture. Exits 1 on failure.

S10 Transport-support labels

The transport-support labels are supplementary provenance and are not used as a construct in the main article. Table S17 defines the labels and Table S18 gives the final label of each dimension: magnitude T3, withdrawal T1, conditionality T2, cadence T1, duration T2 and baseline employment T2. Baseline employment is a state summary and is never labelled T3.

Table S17: Transport-support label definitions.

Label	Meaning
T0	No informative variation
T1	Support from at most one independent family with a compatible estimate and inference beyond a verbal statement
T2	At least two independent families with variation and a compatible estimate with inference beyond a verbal statement (stars or an exact p count here), but no clean discovery-and-validation separation
T3	Independent discovery and validation support possible

Source: `manuscript/supplement/SUPPLEMENTARY_INFORMATION.md` (D047 S10 definitions).

Table S18: Final transport-support labels (supplementary provenance; not a main-text construct).

Dimension	Label	Basis	Changed by RIME
Magnitude (B2)	T3	6 independent families with between-study B2 and E-A + usable U; discovery / validation structure available (D013 B2 precedent, H001 LOSO)	NO
Withdrawal	T1	1 independent family with local strict-compatible support; strict usable families: 1	NO
Conditionality	T2	3 independent families with variation and a strict E-A-compatible estimate with inference beyond verbal; strict pair: 1	NO
Cadence	T1	1 independent family with local strict-compatible support; strict usable families: 0	NO
Duration	T2	35 independent families with different promised horizons; never isolated (entangled with study identity); within-study strict designs: 0	NO
Baseline employment	T2	6 independent families with observed baseline shares (2 with E-A + usable U); a state summary, not a randomised mechanism: no T3	NO

Source: `final_scope_c/FINAL_SCOPE_C_T_SUPPORT.csv`.

Figure S1

Dimension	Stops at	Smallest missing evidence object	Possible source of that object
Withdrawal	estimand	a second independent same-guarantee contrast with a direct employment estimate and SE / CI	existing isolated designs (in principle) or a new trial
Conditionality	uncertainty	SE / CI for an existing isolated contrast with a compatible estimate	existing design (uncertainty only)
Cadence	uncertainty	SE / CI for two independent isolated cadence contrasts	existing designs (reporting / uncertainty)
Duration	isolation	assigned horizon contrasts with employment estimates and SE / CI in two families	likely new designs

Requirements that would change the evidence status; no claim is made that data access or new trials are currently feasible.

Figure S1: Status-changing evidence by dimension (former main Figure 5). For each dimension, the binding support stage and the evidence object whose availability would change its feasibility status. The figure shows no effect sizes, signs or statistical significance, and it makes no claim about whether any route is accessible.
